## **AirPhotoUSA MapHandler v4.0 for ArcGIS 8.x**

### **OVERVIEW**

“AirPhotoUSA MapHandler v4.0 for ArcGIS 8.x” is a program for users that already have an ArcGIS, version 8.1 application installed on their computer. It allows ArcGIS users to open and display the imagery contained in AirPhotoUSA Map files as a layer in an ArcGIS application.

### **LICENSING**

Licensed users of the full version of PhotoMapper may use this MapHandler upon agreeing to the MapHandler’s license agreement. This software will honor PhotoMapper registration so there is no need to re-register. If you are not licensed for the full version of PhotoMapper but are running Lite, Laptop Edition or Network Viewer editions you will need to purchase a license for the full version of PhotoMapper before this software will work for you.

### **USING WITH ARCGIS 8.x**

There is no additional setup required after the setup for MapHandler has been successfully run.

### **MIXING RESOLUTIONS**

MapHandler for ArcGIS 8.x does support viewing maps which contain links to other map files. However, due to the structured interface with ArcGIS 8.x it is not possible to view imagery with different resolutions within the same map file. For example, if you open a map file in ArcGIS that has 2 foot and 1 meter resolution imagery linked together, the MapHandler will display one resolution or the other but not both. You can, however, display separate map files with differing resolutions simultaneously.
